

Memorial Now Offers 3D Mammography

With early detection of breast cancer, the 5-year survival rate is almost 100%.

What should I expect during my 3D Mammogram?

The process of a 3D mammogram is very similar to a conventional 2D mammogram. The technologist positions you, compresses your breast, and takes images from different angles. With a 2D exam, a woman gets two X-rays of each breast, from top to bottom and side-to-side. With three-dimensional imaging, the machine moves around the breast in an arc, taking multiple X-rays from different angles. This technology allows doctors to examine your breast tissue layer by layer.

What are the advantages?

Instead of viewing the complexities of your breast tissue in a flat image, fine details are more visible and no longer hidden by the tissue above or below.

- **Better, earlier detection**
- **Increased accuracy**
- **Greater peace of mind**

Ask your provider to request the 3D tomosynthesis mammogram when writing the order for this screening mammogram.*
